NOTICE FOR EDITORS

Conservation biology is a young scientific discipline, originating from the biological sciences. The discipline tries to provide basic information for the protection of biological diversity. Conservation biology has increasingly developed a trans- and interdisciplinary attitude. Societies today face one of the most serious global problems threatening their future well-being - the extinction of species and the deterioration of the environment. The problems associated with the protection of biological diversity are closely connected to other problems the world currently faces – climatic change, pollution and degradation of the environment, pollution, overpopulation, urbanization or economic and social problems. That is the reason why specialists of many scientific disciplines have joined to provide solutions to the biology.

The Society for Conservation Biology is an international organization dedicated to advancing the science and practice of conservation biology.
